Waste Neutral Group (WNG) provides waste neutral solutions for commercial and institutional applications by evaluating your business processes and waste streams to determine if there are cost effective alternatives to divert needless waste from going to the landfill.

Complete Solutions: PROCUREMENT, EDUCATION, TRAINING (bi-lingual), HAULING, EQUIPMENT

#### RESTAURANTS

Restaurant food discards make up about 40% by weight of your total waste stream and in Maryland approximately 17% of wastes disposed consists of food. This represents almost a million tons.

WNG will help you: Reduce solid waste disposal fees - End wasting large quantities of recyclable raw ingredients - Educate customers on the benefits of food waste composting - Markets your establishment as environmentally conscious - Reduce the need for more landfill space.

#### INSTITUTIONAL

Composting provides institutions with a method to dispose of a large portion of these waste streams in a way that benefits their bottom line and the environment. By composting, an institution avoids high per ton incineration or landfill disposal costs for these dense and heavy materials. Using compost on-site can save the grounds department money by reducing their need to buy mulch, fertilizer, and pesticides, since compost improves soils water retention, aeration, and adds lost nutrients.

#### COMMERCIAL

Every day tenants, customers and employees are looking for more responsible business practices in the places they work, play and shop. WNG will show you how to recalibrate your operations to be more environmentally friendly and socially responsible. We will evaluate all of your waste streams and current infrastructure to determine the most cost effective options for your property.

#### EVENTS

For event organizers, managing this waste (otherwise known as refuse, garbage, or trash) can represent a significant cost, consume many volunteer or staff hours, and presents problems with unsightly litter and nuisances. Much of this material can be recycled or composted, or avoided altogether. In addition to the specific economic and environmental benefits of reducing the amount of waste going to disposal, special events are an ideal forum for promoting recycling by demonstrating that recycling is possible.

#### DECONSTRUCTION

Each year, the United States produces about 100 million tons of construction debris and all but a fraction goes to the landfill. The benefits of deconstruction are: Reduces the overall costs of building removals - Provides lower cost building materials to the community - Extends the life of landfills - Protects the natural environment by reducing the need for the extraction of new resources - Job creation and economic development.
